

Talking Points Commentary For the month ended February 2025

Fixed Income Outlook

We emphasize capital preservation in our active fixed income portfolios while seeking to maintain a yield advantage relative to the benchmark. We expect U.S. growth (real GDP) will slow to trend in 2025. A U.S. recession within the year is not likely as most economic reports suggest the U.S. economy continues to be resilient and stronger than expected. Above target inflation and a strong U.S. labor market have been factors contributing to higher short-term rates; however, these factors are subsiding as the lagged impact of higher rates is impacting demand and slowing some sectors of the economy. The Federal Open Market Committee (FOMC) is expected to slow the pace of rate reductions in 2025 due to elevated inflation readings, a resilient labor market, uncertain tariff policy and an unknown budget resolution. We remain constructive, and very selective toward corporate credit and are comfortable with our strategic credit positioning. Corporate bonds continue to offer some value over government bonds; thus, we maintain our preference for high-quality investment grade corporates. We continue to be positioned with an emphasis on liquidity and quality.

- Headline U.S. GDP increased 2.3% in 4Q 2024 (3.1% in 3Q 2024). Household consumption was the dominant driver to growth. Equipment spending and inventories were the main detractors to growth. Domestic demand is still relatively solid. Additionally, the pace of nominal GDP slowed to 4.8% from 5.0%.
- Focal Points
- The current federal funds target range remained at 4.25%-4.50% after the FOMC's latest meeting. The FOMC's median federal funds forecast for year end 2025 is 3.875%. The FOMC's policy rate is still restrictive, and its employment and inflation goals are roughly in balance.
- U.S. Treasury yields moved lower during the month. Concerns regarding DOGE-related layoffs of federal employees, a slowdown in consumption data, and uncertain tariff policy have been factors in declining rates.
- Corporate bond spreads widened month over month for the same factors highlighted above – federal layoffs (and its impact to labor market), uncertain trade policy, and a slowdown in consumption data.

Macro Update

- U.S. real GDP increased 2.3% in 4Q 2024 (3.1% in 3Q 2024). Household consumption was the dominant driver to growth. Equipment spending and inventories were the main detractors to growth. U.S. final sales to private domestic purchasers (a proxy for domestic demand) remains solid. Quarterly measures of inflation remain above the FOMC's target rate.
- We expect U.S. growth (real GDP) to be around trend (~2.0%) in 2025 due to the underlying strength and resiliency of the U.S. economy and pro-growth Trump administration policies. Recent evidence shows that the labor market is holding up well; however more cyclical industries continue to show relative weakness.

Long-Term Views:

- U.S. growth remains positive while global economic growth remains relatively weak, especially in the Eurozone. Short-term interest rates are now moving lower in many developed markets as inflation moderates.
- Federal Reserve policy will focus on economic growth if inflation moves toward its target rate and the unemployment rate rises. Nominal and real interest rates may remain elevated as U.S. economic growth remains positive.
- Additional disinflation in developed markets may find some resistance due to higher wages, higher food prices, and geopolitical events such as tariffs and on-going conflicts.

Headline inflation in the U.S. and other major economies is no longer decelerating at its prior pace and remains above target levels. U.S. core prices remain elevated and above the FOMC's target as well. We expect inflation to remain anchored over the next twelve months, with elevated uncertainty, due to the administration's potential tariff policy.

Achieving and remaining at the FOMC's twopercent target rate on a sustained basis may be a challenge.

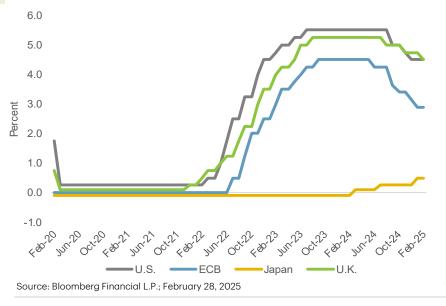

U.S. Central Bank Update

- The FOMC held the federal funds rate steady at its January meeting. The current range is 4.25%-4.50%. The pace of rate cuts will slow in 2025 as economic growth remains solid and the policy rate is less restrictive.
- The Federal Reserve's summary of economic projections for 2025 show above-trend growth, continued disinflation, a slightly weaker labor market, and a declining federal funds rate, to 3.875% by year end 2025. The GDP growth and inflation outlooks will most likely be modified when the administration's economic policies, specifically tariffs, are known and implemented.

Long-Term Views:

- The federal funds effective rate will become less restrictive as the FOMC continues decreasing interest rates. We expect a shallower federal funds rate cut path in 2025 due to an expanding U.S. economy and the new administration's expected economic policies.
- The FOMC is committed to its monetary policy framework and market facilities to support price stability, labor markets, and financial market liquidity.

Cash/Short-term Market Update

- Short-end Treasury yields decreased during the month. Concerns regarding massive layoffs of federal employees, a slowdown in consumption data, and uncertain tariff policy have been factors in declining rates.
- During the month, short-term credit spreads widened 3 bps, to 52 bps. The factors noted above negatively impacted non-Treasury assets. Solid fundamentals, attractive yields, and durable growth support credit spreads.
- Prime money fund assets increased \$50.9 billion during the 3month period ending February 2025. Total assets are \$1,119 billion (up 9% YoY).

Central Banks have kept inflation expectations well anchored by raising their respective policy rates (becoming more restrictive) thereby slowing growth by reducing demand as inflation remains above target.

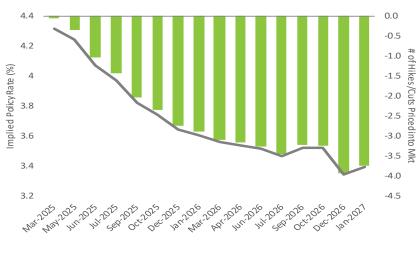

Most major Central Banks are now easing policy restrictions as data are showing moderating growth and disinflation, albeit at a much slower pace. Central Banks are communicating data dependency to determine future policy decisions.

The Federal Reserve reduced the federal funds rate by 1.0 ppt since it began cutting rates with an initial 0.50% cut in September. The upper bound of its target range is 4.50% (as shown in graph).

Current Positioning:

f of Hikes/Cuts Pricedinto

Short and Short/Intermediate Government/ Credit models prefer high-quality investment grade corporate bonds and have a similar duration profile relative to their respective benchmark.

#Hike/Cut

Implied Rate

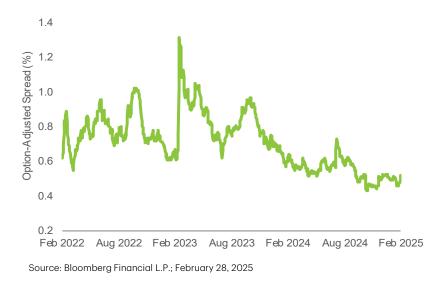

Number of Hikes/Cuts Priced into Market

Fewer rate cuts are expected in 2025 as the FOMC's updated projections indicate that inflation will remain higher for longer. It expects the PCE price index to reach the 2.0% target by year-end 2027 (was year-end 2026).

The implied policy rate reached a peak rate of 5.3% in 2024. This rate is now expected to decline along a much shallower path in 2025 due stronger forecasted real economic growth and uncertainty with respect trade policies under the presidential administration.

1-3 Year Corporate Option-Adjusted Spread (OAS)

U.S. Treasury Market Update

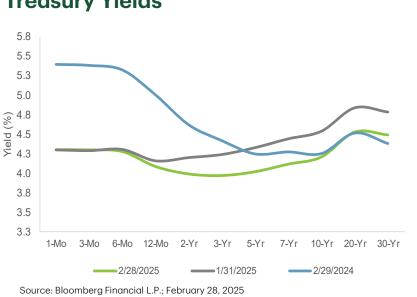

- U.S. Treasury yields moved lower during the month. Concerns regarding DOGE-related layoffs of federal employees, a slowdown in consumption data, and uncertain tariff policy have been factors in declining rates. Recent economic data indicate a weaker consumption outlook.
- The scale and scope of the Trump administration's trade, tax, immigration, and regulatory policies to expected real economic growth and inflation remains uncertain. Overall, these policies have elevated short-term implied inflation rates.

At 52 bps, the index OAS is 3 bps wider from last month end. Year-over-year, the index OAS is 10 bps tighter. Factors which may benefit spreads are moderating inflation, trend GDP growth outlook, and an easing FOMC policy framework. Current geopolitical events continue to minimally impact spreads.

Corporate fundamentals are expected to weaken from strong footing as growth slows toward trend. Financial conditions are not overly restrictive as the FOMC is easing policy restriction and spreads are near multiyear tights.

Current Positioning:

• Government models have similar duration profiles relative to their respective benchmark. We expect interest rates to be more volatile during this period of uncertain fiscal- and traderelated policies.

Treasury Yields

Treasury yields decreased, and the yield curve flattened in February. The spread between 2- and 30-year maturities decreased 9 bps, to 50 bps. The yield gap between the 3-month T-Bill and 10-year Treasury is -9 bps, tighter by 34 bps from last month end.

We expect yields to move lower from current levels as inflation moderates and the FOMC continues reducing interest rates. The FOMC's policy framework is still restrictive. We expect interest rates to be more volatile during this period of uncertain fiscal- and trade-related policies.

Treasury Curves

Investment Grade Credit Market Update

- Corporate bond spreads widened 8 bps, to 87 bps, and the credit curve steepened relative to last month. Timely US economic data show weakening household consumption and overall aggregate demand.
- Investors are showing greater focus on potential negative growth impacts of recent administration policies and policy uncertainty
- Looking forward, corporate fundamentals should remain positive but will continue to weaken from very strong levels as the economy enters a period of trend growth.

Treasury curve steepening momentum paused as investors focus on signs potentially pointing to weaker economic growth and sticky inflation outlooks. The 2s10s curve fell 12 bps, to 22 bps. Highlighting the relative strength in the belly of the yield curve, the 2s5s curve, at 3 bps, decreased 10 bp.

Current Positioning:

 Government/Credit models remain overweight the corporate sector, mostly in the banking industry, and have similar duration profiles relative to their respective benchmark.

Corporate Spread & Issuance

In February, corporate bond issuance was \$160 billion, a 19% decrease from the same period last year. The cumulative 12-month change is 16.6%. The spread on the corporate bond index, at 87 bps, is 8 bps wider on the month.

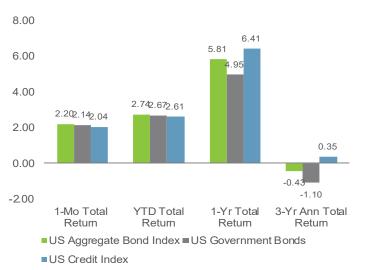

Consensus 2025 corporate bond issuance is similar to 2024's tally of \$1.55 trillion.
